Garland, TX

Dear Google hiring manager,

Having been through previous programming projects, internship, and Computer Science courses, I have learned the applications of various programming languages and systems in a commercial and theoretical setting. I have obtained experience in working with information technology by solving problems that arise from existing tech infrastructure in a high-demand setting.

As the current Web developer lead for the Society of Hispanic Engineers at UTD, and having worked in software engineering for ACM Project, I have the skills in demand to be a software engineering intern at Google. Having led a group to divide tasks considering each other's strengths, I will be able to communicate and word accordingly, making the process of working in a team smoother.

Throughout my academic journey, I have applied myself in extracurriculars that have honed in my expertise in programming. From the classroom to organization, I have been able to lead and teach in a lot of these roles. One memorable moment was being able to lead the front-end team for my project as my team and I worked on a project for ACM projects.

Adaptability and being able to work with what is thrown at me is a challenge that I like putting on myself. This challenge leads to me learning new platforms and applying them in new settings. I look forward to the opportunity of being a software engineering intern at Google; I know that I have what it is demand for the role, and I look to apply the skills I have attained in this role!

Thanks,
Angel Gomez
